In the production of cigarettes, filters are known in which the filter material is comprised of a mixture of cellulose acetate fibers, nitrocellulose fibers, titanium dioxide fibers and other non-woven materials which are usually applied to the wrapper of the tobacco rod by pressing the mixture of material between a male and a female die. As a rule, the smoking articles produced by this method have a uniformity of color of the wrapper and filter of not more than about 20 percent. Accordingly, it is a broad object of the present invention to provide a tobacco filter having a tobacco wrapper that has a hue, particularly a hue index, that differs from the usual standard hue of the tobacco wrapper. The object and advantages of the invention will become more apparent from the following detailed description thereof.

Long-term birth outcomes from term pregnancy: a comparison of infants fed on demand or exclusively breastfed. To compare the long-term health of term infants fed on demand with those fed exclusively on breast milk. In a prospective cohort of 2041 healthy, term mother-infant pairs, infants were assigned randomly at birth to one of three feeding groups: breast milk, breast milk and formula or breast milk and other infant foods. The maximum follow-up for cohort was 8 years. The primary outcome measures were: (i) retinopathy of prematurity (ROP), (ii) neurological impairment (cerebral palsy or learning difficulties) and (iii) sleep or behavioural disturbances. At 8 years, the total follow-up was 1572 child-years and the incidence of each of the three outcomes was 4.5% (95% CI 3.3-6.1), 1.5% (0.8-2.8) and 2.9% (1.9-4.4), respectively. After allowing for possible confounding by clustering, the rate of ROP, neurological impairment and sleep or behavioural disturbances were similar in the three feeding groups. These data do not support breast milk feeding as being associated with a higher risk of ROP, neurological impairment and sleep or behavioural disturbances in a cohort of term infants.
