Moderate summer storm An extreme summer storm is a severe thunderstorm with hail larger than that occurs between late June and early September. During the months of June to September, thunderstorms are known to occur throughout the United States and Canada, with the likelihood of such thunderstorms occurring increasing as temperatures rise. Those thunderstorms that do develop can pose a significant threat to life and property. Damage can include isolated tornadoes, flash floods, wind damage, hail damage and large hailstones. Meteorological features The storms that are the most dangerous are often severe thunderstorms, which are characterised by at least a cloud-to-ground hailstorm and damaging wind gusts to. Precipitation will commonly be concentrated into severe thunderstorms, which are typically developed over warm ground such as the southern plains, southeastern U.S., coastal United States and 82157476af
